

Abstract of the Disclosure

5 A geographic-based communications service system has
a mobile unit for transmitting/receiving information, and
access points connected to a network. The access points
are arranged in a known geographic locations and transmit
and receive information from the mobile unit. When one
of the access points detects the presence of the mobile
unit, it sends a signal to the network indicating the
location of the mobile unit and the information requested
10 by the mobile unit. Based on the signal received from the
access point, the network communicates with information
providers connected to the network and provides data to
the mobile unit through the access point corresponding to
the location of the mobile unit.
